The following specification particularly describes the invention and the manner in which it is to be performed

Octagonal Multi-Cartridge Lipstick Assembly for Multi-Color Cosmetic Application

FIELD OF INVENTION

The present invention relates to cosmetic products.

BACKGROUND OF THE INVENTION

Conventional lipstick designs are primarily cylindrical and limited to a single color per container. While multi-color lip palettes exist, they are often bulky and require applicators. Consumers who wish to carry multiple lipstick shades simultaneously must either carry multiple cylindrical sticks or use large cosmetic kits, which is inconvenient. Moreover, cylindrical lipsticks are prone to rolling when placed on flat surfaces, increasing the risk of damage. A need exists for a compact, multi-shade lipstick system that is easy to carry, stable, and provides quick shade-switching capability. There are few patents which focuses on the issue but they do not have accurate resolution for the issue.

WO 2023/212158 A1 — Refillable Lipstick — A refillable lipstick is disclosed. In one embodiment, the refillable lipstick includes a lipstick cap and a base. The base includes a first portion and a second portion. The refillable lipstick further includes a lipstick refill comprising a carrier, a shaft connected to the carrier, and a cosmetic (such as a lipstick cosmetic). The carrier is configured to be received in the base, and the cosmetic is configured to extend through the second portion of the base. The refillable lipstick may also include a mechanism to extend and retract the cosmetic by moving the shaft relative to the carrier.

US 2024/0017185 A1 — Spinner Device — A spinner device for an elongated object is disclosed. The device comprises a main body with an increased-thickness area (such as a raised circle, square, triangle, or octagon) to allow a user to spin the elongated object. The elongated object may be, for example, a pen, pencil, lipstick container, or similar tubular item. The device is configured to engage with the object and facilitate spinning, twirling, or manipulation by a user for entertainment or stress relief purposes.

The existing patents referencing octagonal forms either focus on refill mechanisms (WO2023212158), spinner devices for elongated objects like lipsticks (US20240017185), with the octagonal geometry serving merely as an optional or incidental feature rather than a functional core. In contrast, an octagonal lipstick with multiple shades directly leverages the eight flat faces of the geometry to house or orient different color compartments, providing users with compact convenience, improved grip, and anti-rolling stability while offering an aesthetically distinctive design. This combination of ergonomic advantage and shade integration is absent in the prior arts, thereby establishing both functional novelty and inventive step that make the octagonal multi-shade lipstick superior.

SUMMARY OF THE INVENTION

The present invention provides a lipstick assembly (100) with an octagonal housing that incorporates multiple lipstick cartridges (101), each mounted on one facet of the octagon. Key features that are included in the current invention is, an octagonal central body (103) that provides anti-rolling stability. Multiple lipstick cartridges (101), each of a different color, arranged radially around the facets of the octagon. A mechanism for selective extension and retraction of individual lipstick cartridges (101). Enhanced portability, aesthetic appeal, and ergonomics compared to conventional multi-shade cosmetic kits. This design combines functionality (multi-color in one) and aesthetic innovation (unique octagonal geometry). It also has a push-knob switch (102) to retract and extract the cartridges (101).

DETAILED DESCRIPTION OF THE INVENTION

Multi-shade portability provides up to eight lipsticks (101) can be carried in one compact structure (100). Anti-roll stability allows the octagonal shape (100) prevents rolling on flat surfaces. User convenience aimed to quickly switching between shades without carrying multiple sticks. Aesthetic differentiation allowing unique geometric and color-rich design appeals to consumers. Ergonomic grip (103) with flat facets provide secure grip compared to cylindrical casings. Materials and Manufacturing of the housing (100) may be moulded from plastic, metal, or biodegradable composite material. The lipstick sticks (100) are composed of standard cosmetic formulations. The cartridges (101) may be designed as refillable modules, enhancing sustainability.

To refill, each cartridge (101) the housing is a removable or replaceable structure, enabling users to eject the depleted lipstick bullet and insert a new refill with ease. This could be accomplished through a push-knob (102) mechanism that provides both secure locking during use and easy release for refilling. Clear labelling or subtle orientation guides can help users insert refills correctly, while durable, easy-to-clean materials ensure longevity and hygienic use.

To refill, a user opens or detaches the cartridge (101), removes the depleted bullet, and replaces it with a new one, then reattaches the cartridge (101) to the octagonal housing (100). The lipstick becomes immediately selectable and ready for use via the principle mechanism, of push-slide. This design supports eco-friendly versatility and multi-shade portability, reduces waste, and aligns with the benefits of anti-roll stability, grip, and aesthetics provided by the patented multi-cartridge housing.

BRIEF DESCRIPTION OF THE DRAWINGS

In FIG. 1, the invention comprises an octagonal housing (100) serving as the core structure. Around its eight outer facets, lipstick cartridges (101) are mounted, each containing a different lipstick color. The cartridges (101) are held in sliding or twist-lock slots. Each cartridge (101) is configured with a dispensing mechanism of push-knob switch (102) with a diameter of 2mm that allows the user to selectively extend a chosen lipstick stick for application. In this embodiment, the mechanism is a push-slide knob (102) located at the base of each cartridge (101), integrated into the housing.

TITLE: OCTAGONAL MULTI-CARTRIDGE LIPSTICK ASSEMBLY FOR MULTI-COLOR COSMETIC APPLICATION

ABSTRACT

The invention discloses a lipstick assembly featuring an octagonal housing (100) designed to hold multiple lipstick cartridges (101) within a single compact unit. Each facet of the housing accommodates one cartridge, enabling users to store and select various shades conveniently. The octagonal geometry provides anti-rolling stability (103), improved ergonomic grip (103), and a distinctive appearance compared to traditional cylindrical lipsticks. Each cartridge (101) includes an extension and retraction mechanism, such as a push-slide knob (102), for controlled shade selection and precise application. The housing (100) is detachable, allowing easy cartridge replacement or refilling when depleted. Materials for construction may include plastic, metal, or biodegradable composites, with refillable cartridges (101) offered for sustainability. By integrating multi-shade portability, stability, durability, and unique aesthetics, this invention delivers a consumer-friendly cosmetic solution that merges functional convenience with ornamental innovation, redefining the design and usability of conventional lipsticks.

WE CLAIM

1. An octagonal lipstick assembly(100), comprising:
 - a. An octagonal housing having eight outer facets;
 - b. A plurality of lipstick cartridges (101), each mounted on one of said facets; and a push-slide knob (102) mechanism for selectively extending and retracting each lipstick cartridge.
2. The octagonal lipstick (100) assembly of claim 1, wherein the octagonal housing provides anti-roll (103) stability when placed on flat surfaces.
3. The octagonal lipstick (100) assembly of claim 1, wherein the lipstick cartridges (101) are of different colours, enabling multi-shade application.
4. The octagonal lipstick (100) assembly of claim 1, wherein the cartridges (101) are added as refillable modules (101).
5. The octagonal lipstick (100) assembly of claim 1, wherein the extension mechanism comprises a push-slide knob (102), dispensing control (103).
6. The octagonal lipstick (100) assembly of claim 1, wherein the housing (100) is constructed from biodegradable composite materials.
7. The octagonal lipstick (100) assembly of claim 1, wherein the flat facets of the octagon provide enhanced user grip (103) during application.
8. The octagonal lipstick (100) assembly of claim 1, wherein the geometric configuration (103) enhances aesthetic differentiation compared to cylindrical lipsticks.
